Yesterday's session : DB Design and Static data insertion

-> If application is performing DML opeation on the table then that table is called as
'Transactional' table.

-> If application is only reading data from table then that table is called as 'Non-
Transactional' table. It is also called as Static Table.

-> For static tables data will be inserted in the database directley.

Today's session : Service Layer Design

```java
public interface UserService{

        //Registration page operations
        public Map<Integer, String> findCountries();

        public Map<Integer, String> findStates(Integer countryId);

        public Map<Integer, String> findCities(Integer stateId);

        public boolean isEmailUnique(String emailId);

        public boolean saveUser(UserMaster um);

        //Login page operations
        public String loginCheck(String email, String pwd);

        //Unlock Account Operations
        public boolean isTempPwdValid(String email, String tempPwd);

        public boolean unlockAccount(String email, String newPwd);

        //Forgot Password Operations
        public String forgotPassword(String email);

}
```
